Keywords

Optical VHR, image quality, CwRS management

Abstract

Optical VHR satellite capacity available for CwRS has substantially increased during the past 10 years and will continue to increase in the coming years. Consequently, the focus of successful CwRS campaigns is no longer solely complete order fulfillment but increasingly shifting towards image quality in all its aspects.

The presentation will address relevant criteria for image quality and how EUSI manages to fulfill these criteria by utilizing a fleet of satellites, the Constellation Direct Facility (cDAF) near Munich, cooperation with international partners around the globe as well as improved image processing methods.
